

Innovation Document – Movie App Project Student

Student ID: GOO472889

For this project, I implemented several features and design choices that go beyond the basic requirements to improve the app's usability and professional look:

1. **Enhanced Favourites Management:** While the brief required adding and removing favourites, I added a dedicated trash can icon on the Favourites page. I also implemented `stopPropagation()` in the code so that when a user clicks the trash icon to delete a movie, it doesn't accidentally trigger the link to open the Movie Details page at the same time. This makes the list much easier to manage.
2. **Horizontal Cast Gallery:** Instead of a standard vertical list for the cast, I created a horizontal scroll container. This allows the user to see a large number of actors quickly without having to scroll all the way down the page, keeping the "Overview" and "Crew" sections more accessible.
3. **Visual Styling & UI Polish:** To make the app look more modern, I used custom CSS to create rounded images (`border-radius`) for all cast and crew thumbnails. I also added a "hand" cursor pointer and hover effects to clickable elements to make it clear to the user that the actors and crew members are links to the Details page.
4. **Optimized List Lengths:** In my `MovieDetailsPage`, I used data slicing to limit the cast and crew displays to the top 15 members. This ensures the page stays clean and performant, avoiding "information overload" for the user while still providing plenty of information.
5. **Defensive Image Handling:** I implemented a logic check for all profile images. If a person does not have a photo available on the TMDB API, the app automatically displays a standard Ionic Avatar SVG as a placeholder. This prevents "broken image" icons and keeps the UI looking professional.
